

## PROBLEM SOLVER

### PROBLEM:

**Ordinary butt connectors are unreliable and can lead to unsafe situations.**

- Wire is difficult to install into the terminal.
- Insulation splits during crimping.
- Butted seam barrels separate during crimping.
- Wires pull out easily.
- Short barrels result in poor electrical connections and cause shorts, high electrical resistance, heat buildup and failure.

### SOLUTION:

## Superbutt Nylon-Insulated Butt Connectors

- Wire installs easily into terminal funnel entry.
- Supple nylon insulation and seamless barrel will not split or break during crimping.
- Longer internal splice and double crimp design prevents wire pull-out.
- Longer barrel provides maximum electrical connection to prevent shorts, reduce electrical resistance, and prevent heat buildup and failure.
- UL and CSA rated to 600V

### APPLICATIONS:

- Computer and electronic repair
- Automobile and truck repair
- High-vibration applications such as:
  - Printing presses
  - Asphalt and cement plants
  - Farm equipment
  - Assembly line equipment
  - Robotics
  - Mine equipment
  - Road repair equipment

### INDUSTRIES:

- Agriculture
- Automotive
- Construction
- Equipment Rental
- Manufacturing
- Mining
- Transportation
- Waste Management

Insert wire into terminal

Make first crimp

Make second crimp onto insulation

Properly installed terminal
